

Flow layout

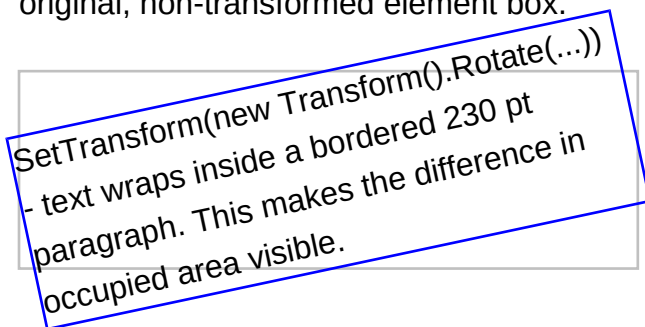

Gray rectangles mark the occupied areas calculated by the layout engine.

`setRotationAngle` changes the layout element rotation. The occupied area used by the layout engine is calculated for the rotated element.

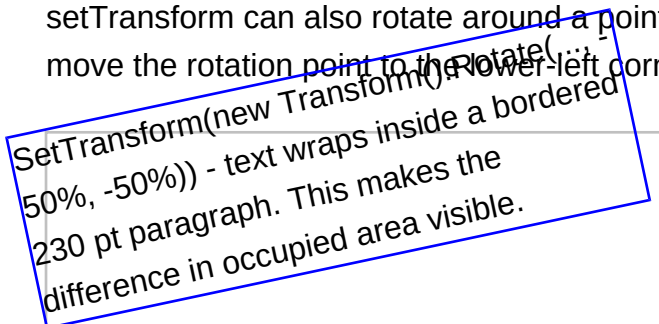

Next paragraph after the transformed element.

`setTransform` changes the drawing while rendering. The following content is laid out after the original, non-transformed element box.

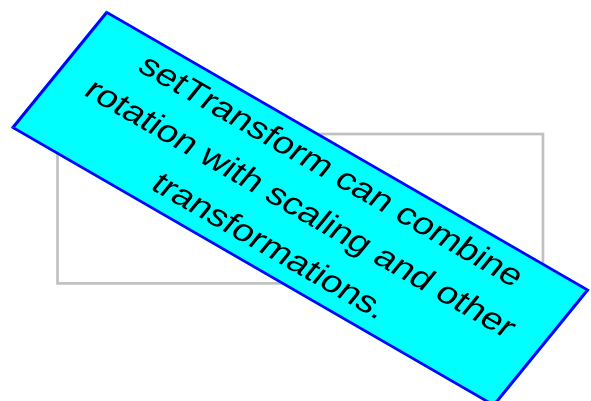

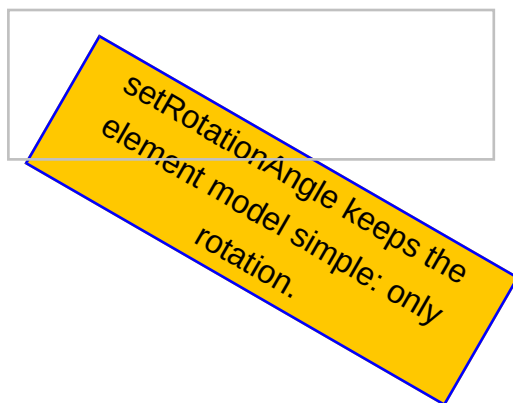

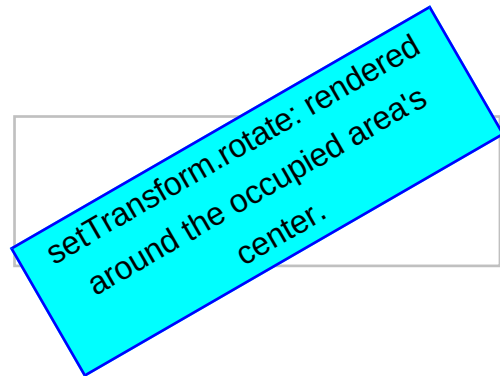

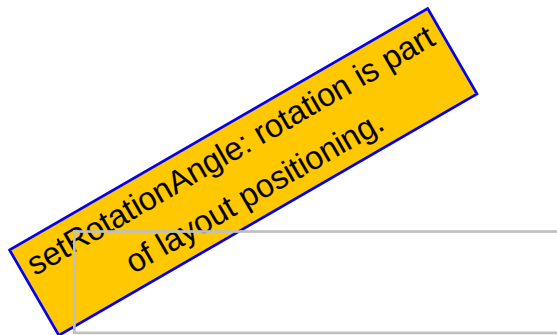

Next paragraph after the transformed element.

`setTransform` can also rotate around a point other than the element center. Here -50% and -50% move the rotation point to the lower-left corner.

Next paragraph after the transformed element.

Fixed position

Gray rectangles mark the fixed-position boxes before rotation or transform.
